Objectives and Guiding Principles of CCSE

In the fall of 1998, the Educational Activities Board of the IEEE Computer Society and the ACM Education Board appointed representatives to a joint task force whose mission was to perform a major review of curriculum guidelines for undergraduate programs in computing. This activity, named Computing Curricula, and their corresponding final reports, which are listed as volumes II-V for the areas of Computer Science, Computer Engineering, Software Engineering, and Information Systems, are in varying stages of completion. The effort to create the software engineering volume is referred to as Computing Curricula Software Engineering (CCSE).

The CCSE steering committee is under the guidance and direction of both the IEEE Computer Society and the Association for Computing Machinery (see Appendix A for membership). The steering committee contains members whose mission is to guide the construction and detailing of the educational knowledge areas, guide the partitioning of these topics into a variety of academic classification schemes and implementations, and oversee the structure and content of the volume. Other members serve as representatives to the views and perspectives of related professional groups: namely, the ACM, the ACM's software engineering special interest group, the two-year and community colleges subgroup of the ACM Educational Board, the Australian Computer Society, the British Computer Society, and the Information Processing Society of Japan. As demonstration of the steering committee's commitment to generate an international curriculum, several international representatives also serve as members. In its entirety, the membership of the steering committee represents the countries of Australia, Canada, Israel, Japan, the United Kingdom, and the United States. The steering committee also seeks guidance from an advisory board.

CCSE Principles

The steering committee has articulated the following principles to guide our work:

1. *Computing is a broad field that extends well beyond the boundaries of any one computing discipline.* CCSE concentrates on the knowledge and pedagogy associated with a software engineering curriculum. Where appropriate, it will share or overlap with material contained in other Computing Curriculum reports and will offer guidance on its incorporation into other disciplines.
2. *Software Engineering draws its foundations from a wide variety of disciplines.* Undergraduate study of software engineering relies on many areas in computer science for its theoretical and conceptual foundations, but it also requires students to utilize concepts from a variety of other fields, such as mathematics, engineering and project management. All software engineering students must learn to integrate theory and practice, to recognize the importance of abstraction and modeling, to be able to acquire special domain knowledge beyond the computing discipline for the purposes of supporting software development in specific domains of application, and to appreciate the value of good engineering design.

3. *The rapid evolution and the professional nature of software engineering require an ongoing review of the corresponding curriculum.* The professional associations in this discipline must establish an ongoing review process that allows individual components of the curriculum recommendations to be updated on a recurring basis. Also, because of the special professional responsibilities of engineers to the public, it is important that the curriculum guidance support and promote effective external assessment and accreditation of software engineering programs.

4. *Development of a software engineering curriculum must be sensitive to changes in technology, new developments in pedagogy, and the importance of lifelong learning.* In a field that evolves as rapidly as software engineering, educational institutions must adopt explicit strategies for responding to change. Institutions, for example, must recognize the importance of remaining abreast of well-established progress in both technology and pedagogy, subject to the constraints of available resources. Software engineering education, moreover, must seek to prepare students for lifelong learning that will enable them to move beyond today's technology to meet the challenges of the future.

5. *CCSE must go beyond knowledge elements to offer significant guidance in terms of individual curriculum components.* The CCSE curriculum models should assemble the knowledge elements into reasonable, easily implemented learning units. Articulating a set of well-defined models will make it easier for institutions to share pedagogical strategies and tools. It will also provide a framework for publishers who provide the textbooks and other materials.

6. *CCSE must support the identification of the fundamental skills and knowledge that all software engineering graduates must possess.* Where appropriate, CCSE must help define the common themes of the discipline and ensure that all undergraduate program recommendations include this material.

7. *Guidance on software engineering curricula must be based on an appropriate definition of software engineering knowledge.* The description of this knowledge should be concise, appropriate for undergraduate education, and it should use the work of previous studies on the software engineering body of knowledge. A core set of required topics, from this description, must be specified for all undergraduate software engineering degrees. The core should have broad acceptance by the software engineering education community. Coverage of the core will start with the introductory courses, extend throughout the curriculum, and be supplemented by additional courses that may vary by institution, degree program, or individual student.

8. *CCSE must strive to be international in scope.* Despite the fact that curricular requirements differ from country to country, CCSE is intended to be useful to computing educators throughout the world. Where appropriate, every effort is being made to ensure that the curriculum recommendations are sensitive to national and cultural differences so that they will be widely applicable throughout the world. The involvement by national computing societies and volunteers from all countries will be actively sought and welcomed.

9. *The development of CCSE must be broadly based.* To be successful, the process of creating software engineering education recommendations must include participation from the many perspectives represented by software engineering educators and by industry, commerce, and government professionals.

10. *CCSE must include exposure to aspects of professional practice as an integral component of the undergraduate curriculum.* The education of all software engineering students must include student experiences with the professional practice of software engineering. The professional practice of software engineering encompasses a wide range of issues and activities including problem solving, management, ethical and legal concerns, written and oral communication, working as part of a team, and remaining current in a rapidly changing discipline.

11. *CCSE must include discussions of strategies and tactics for implementation, along with high-level recommendations.* Although it is important for CCSE to articulate a broad vision of software engineering education, the success of any curriculum depends heavily on implementation details. CCSE must provide institutions with advice on the practical concerns of setting up a curriculum.

Curriculum Outcomes

As a first step in SE curriculum guidance the steering committee has developed the following set of outcomes for an undergraduate curriculum in software engineering:

Graduates of an undergraduate SE program must be able to:

1. Work as part of a team to develop and deliver executable artifacts.
2. Understand the process of determining client needs and translating them to software requirements.
3. Reconcile conflicting objectives, finding acceptable compromises within limitations of cost, time, knowledge, existing systems, and organizations.
4. Design appropriate solutions in one or more application domains using engineering approaches that integrate ethical, social, legal, and economic concerns.
5. Understand and be able to apply current theories, models, and techniques that provide a basis for software design, development, implementation and verification.
6. Negotiate, work effectively, provide leadership where necessary, and communicate well with stakeholders in a typical software development environment.
7. Learn new models, techniques, and technologies as they emerge.

Process of Determining the SEEK

The development model chosen for determining CCSE was based on the model used to construct the Computer Science Volume (CCCS). Development of the CCSE volume has been divided into two groups: an Education Knowledge Area Group and a Pedagogy Focus Group. The education knowledge area group is responsible for defining and documenting a software engineering education body of knowledge appropriate for guiding the development of undergraduate software engineering curricula (see Appendix B for list). This body of knowledge is called Software Engineering Education Knowledge or SEEK. The pedagogy focus group is responsible for using SEEK to formulate guidance for pedagogy as well as course and curriculum design to support undergraduate software engineering degree programs.

The initial selection of the SEEK areas was based on the SoftWare Engineering Body Of Knowledge (SWEBOK) knowledge areas and multiple discussions with dozens of SEEK area volunteers. The SEEK area volunteers were divided into groups representing each individual SEEK area where each group contained roughly seven volunteers. These groups were assigned the task of providing the details of the units that compose a particular educational knowledge area and the further refinement of these units into topics. To facilitate their work, references to existing related software engineering body of knowledge efforts (e.g. SWEBOK, CSDP Exam, and SEI curriculum recommendations) and a set of templates for supporting the generation of units and topics were provided.

After the volunteer groups generated an initial draft of their individual education knowledge area details, the steering committee held a face-to-face forum that brought together education knowledge and pedagogy area volunteers to iterate over the individual drafts and generate an initial draft of the SEEK (see Appendix C for attendee list). This workshop held with this particular goal mirrored a similar overwhelmingly successful workshop held by CCCS at this very point in their development process. Once the content of the education knowledge areas were stabilized, topics were identified to be core or elective. Topics were also labeled with one of three Bloom's taxonomy's levels of educational objectives; namely, knowledge, comprehension, or application. Only these three levels of learning were chosen from Bloom's taxonomy since they represent what knowledge may be reasonably learned during an undergraduate education.

The workshop resulted in a complete internal draft of SEEK. The steering committee then arranged for a review of the internal draft by selected experts in the field, the advisory industrial council, and the knowledge area volunteers (see Appendix D for list). After this review was complete, the steering committee studied all reviewer comments and used them to revise the internal draft version of the SEEK. This work resulted in a public draft version of the SEEK. The steering committee has made this version of the SEEK available to the public and is soliciting reviews of it by those interested in undergraduate software engineering education.

After the completion of the public reviews of this document, the steering committee iterated over the reviewer comments to further refine and improve the contents of the SEEK. The public draft version was used at the start of the development of pedagogy, courses, and curricula. The final version was included in the first draft version of the CCSE Volume.

Knowledge Areas, Units, and Topics

Knowledge is a term used to describe the whole spectrum of content for the discipline: information, terminology, artifacts, data, roles, methods, models, procedures, techniques, practices, processes, and literature. The SEEK is organized hierarchically into three levels. The highest level of the hierarchy is the education knowledge **area**, representing a particular sub-discipline of software engineering that is generally recognized as a significant part of the body of software engineering knowledge that an undergraduate should know. Knowledge areas are high-level structural elements used for organizing, classifying, and describing software engineering knowledge. Each area is identified by an abbreviation, such as PRF for professional practices and is represented in this document with the color orange. Each area is broken down into smaller divisions called **units**, which represent individual thematic modules within an area. Adding a two or three letter suffix to the area identifies each unit; as an example, PRF.com is a unit on communication skills. Units are represented in this document with the color yellow. Each unit is

further subdivided into a set of **topics**, which are the lowest level of the hierarchy. Topics are represented with either the color teal or white.

Core Material

In determining the SEEK, the steering committee recognizes that software engineering, as a discipline, is relatively young in its maturation and common agreement on definition of an education body of knowledge is evolving. The SEEK developed and presented in this document is based on a variety of previous studies and commentaries on the recommended content for the discipline. It was specially designed to support the development of undergraduate software engineering curricula, and therefore, does not include all the knowledge that would exist in a more generalized body of knowledge representation. The steering committee has therefore sought to define a **core** consisting of the essential material that professionals teaching software engineering agree is necessary for anyone to obtain an undergraduate degree in this field. By insisting on a broad consensus in the definition of the core, the steering committee hopes to keep the core as small as possible, giving institutions the freedom to tailor the elective components of the curriculum in ways that meet their individual needs. Material offered as part of an undergraduate program that falls outside the core is considered to be **elective**. Core topics are represented with the color teal and elective topics are represented with no color (white).

The following points should be emphasized to clarify the relationship between the SEEK and the steering committee's ultimate goal of providing undergraduate software engineering curriculum recommendations.

- *The core is not a complete curriculum.* Because the core is defined as minimal, it does not, by itself, constitute a complete undergraduate curriculum. Every undergraduate program must include additional elective units from the body of knowledge, although this document does not define what those units will be.
- *Core units are not necessarily limited to a set of introductory courses taken early in the undergraduate curriculum.* Although many of the units defined as core are indeed introductory, there are also some core units that clearly must be covered only after students have developed significant background in the field. For example, topics in such areas as project management, requirements elicitation, and abstract high-level modeling may require knowledge and sophistication that lower-division students do not possess. Similarly, introductory courses may include elective units alongside the coverage of core material. The designation *core* simply means *required* and says nothing about the level of the course in which it appears.

Unit of Time

The SEEK must define a metric that establishes a standard of measurement in order to judge the actual amount of time required to cover a particular unit. Choosing such a metric was quite difficult for the steering committee because no standard measure is recognized throughout the world. For consistency with the earlier curriculum reports, namely the other related computing curricula volumes to this effort, the task force has chosen to express time in **hours**. An hour corresponds to the actual in-class time required to present the material in a traditional lecture-oriented format (referred to in this document as contact hours). To dispel any potential

confusion, however, it is important to underscore the following observations about the use of lecture hours as a measure:

- *The steering committee does not seek to endorse the lecture format.* Even though we have used a metric that has its roots in a classical, lecture-oriented format, the steering committee believes that there are other styles—particular given recent improvements in educational technology—that can be at least as effective. For some of these styles, the notion of hours may be difficult to apply. Even so, the time specifications should at least serve as a comparative measure, in the sense that a 5-hour unit will presumably take roughly five times as much time to cover as a 1-hour unit, independent of the teaching style.
- *The hours specified do not include time spent outside of class.* The time assigned to a unit does not include the instructor’s preparation time or the time students spend outside of class. As a general guideline, the amount of out-of-class work is approximately three times the in-hours (3 in class and 9 outside).
- *The hours listed for a unit represent a minimum level of coverage.* The time measurements assigned for each unit should be interpreted as the *minimum* amount of time necessary to enable a student to perform the learning objectives for that unit. It is always appropriate to spend more time on a unit than the mandated minimum.

Relationship of the SEEK to the Curriculum

The SEEK does not represent the curriculum, but rather provides the foundation for the design, implementation and delivery of the educational units that make up a software engineering curriculum. Other chapters of the CCSE Volume provide guidance and support on how to use the SEEK to develop a curriculum. In particular, the organization and content of the knowledge areas and knowledge units should not be deemed to imply how the knowledge should be organized into education units or activities. For example, the SEEK does not advocate a sequential ordering of the KAs (1st CMP, 2nd FND, 3rd PRF, etc.). Nor does it suggest how topics and units should be combined into education units. Furthermore, the SEEK is not intended to purport any special curriculum development methodology (waterfall, incremental, cyclic, etc.).

Selection of Knowledge Areas

The initial selection of the SEEK areas was based on the SoftWare Engineering Body Of Knowledge (SWEBOK) knowledge areas and multiple discussions with dozens of SEEK area volunteers. Both the CCSE Steering Committee and the SEEK area volunteers felt strongly about emphasizing the academic discipline of software engineering. During the SEEK development process, the area chosen to represent the theoretical and scientific foundations of developing software products subsequently grew to the size of one half of the core. This prompted the Steering Committee to reevaluate whether the original goals of emphasizing the discipline were indeed being met. The resulting set of knowledge areas are believed to stress the fundamental principles, knowledge, and practices that underlie the software engineering discipline.

SE Education Knowledge Areas

In this section, we describe the ten knowledge areas that make up the SEEK: Computing Essentials (CMP), Mathematical & Engineering Fundamentals (FND), Professional Practice (PRF), Software Modeling & Analysis (MAA), Software Design (DES), Software Verification & Validation (VAV), Software Evolution (EVL), Software Process (PRO), Software Quality (QUA), and Software Management (MGT). The knowledge areas do not include material about continuous mathematics or the natural sciences; the needs in these areas will be discussed in other parts of the CCSE Volume. For each knowledge area, there is a short paragraph description and then a table that delineates the units and topics for that area. Each area's topics are listed with one of three attributes: the Bloom's taxonomy level (what capability should a graduate possess concerning the topic), whether a topic is essential (or desirable or optional) to the core, and the recommended core contact hours for the unit.

Bloom's attributes are specified using one of the letters k, c, or a, which represent:

- Knowledge (k) - remembering previously learned material. Test observation and recall of information, i.e., "bring to mind the appropriate information" (e.g. dates, events, places, knowledge of major ideas, mastery of subject matter).
- Comprehension (c) - understanding information and ability to grasp meaning of material presented. For example, translate knowledge to a new context, interpret facts, compare, contrast, order, group, infer causes, predict consequences, etc.
- Application (a) - ability to use learned material in new and concrete situations. For example, the use of information, methods, concepts, and theories to solve problems requiring the skills or knowledge presented.

A topic's relevance to the core is represented as follows:

- Essential (E) - the topic is part of the core.
- Desirable (D) - the topic is not part of the SEEK core, but it should be included in the core of a particular program if possible; otherwise, it should be considered as part of elective materials.
- Optional (O) - the topic should be considered as elective only.

Computing Essentials

Description

Computing essentials includes the computer science foundations that support the design and construction of software products. This area also includes knowledge about the transformation of a design into an implementation, the tools used during this process, and formal software construction methods.

Mathematical and Engineering Fundamentals

Description

The mathematical and engineering fundamentals of software engineering provide theoretical and scientific underpinnings for the construction of software products with desired attributes. These fundamentals support describing software engineering products in a precise manner. They provide the mathematical foundations to model and facilitate reasoning about these products and their interrelations, as well as form the basis for a predictable design process. A central theme is engineering design: a decision-making process of iterative nature, in which computing, mathematics, and engineering sciences are applied to deploy available resources efficiently to meet a stated objective.

Professional Practice

Description

Professional Practice is concerned with the knowledge, skills, and attitudes that software engineers must possess to practice software engineering in a professional, responsible, and ethical manner. The study of professional practices includes the areas of technical communication, group dynamics and psychology, and social and professional responsibilities.

Software Modeling and Analysis

Description

Modeling and analysis can be considered core concepts in any engineering discipline since they are essential to documenting and evaluating design decisions and alternatives. Modeling and analysis is first applied to the analysis, specification, and validation of requirements. Requirements represent the real world needs of users, customers and other stakeholders affected by the system and the capabilities and opportunities afforded by software and computing technologies. The construction of requirements includes an analysis of the feasibility of the desired system, elicitation and analysis of stakeholders' needs, the creation of a precise description of what the system should and should not do along with any constraints on its operation and implementation, and the validation of this description or specification by the stakeholders.

Software Design

Description

Software design is concerned with issues, techniques, strategies, representations, and patterns used to determine how to implement a component or a system. The design will conform to functional requirements within the constraints imposed by other requirements such as resource, performance, reliability, and security. This area also includes specification of internal interfaces among software components, architectural design, data design, user interface design, design tools, and the evaluation of design.

Software Verification and Validation

Description

Software verification and validation uses both static and dynamic techniques of system checking to ensure that the resulting program satisfies its specification and that the program as implemented meets the expectations of the stakeholders. Static techniques are concerned with the analysis and checking of system representations throughout all stages of the software life cycle while dynamic techniques involve only the implemented system.

Software Evolution

Description

Software evolution is the result of the ongoing need to support the stakeholders' mission in the face of changing assumptions, problems, requirements, architectures and technologies. It is intrinsic to all real world software systems. Support for evolution requires numerous activities both before and after each of a succession of versions or upgrades (releases) that constitute the evolving system. Evolution is a broad concept that expands upon the traditional notion of software maintenance.

Software Process

Description

Software process is concerned with knowledge about the description of commonly used software life-cycle process models and the contents of institutional process standards; definition, implementation, measurement, management, change and improvement of software processes; and use of a defined process to perform the technical and managerial activities needed for software development and maintenance.

Software Quality

Description

Software quality is a pervasive concept that affects, and is affected by all aspects of software development, support, revision, and maintenance. It encompasses the quality of work products developed and/or modified (both intermediate and deliverable work products) and the quality of the work processes used to develop and/or modify the work products. Quality work product attributes include usability, reliability, safety, security, maintainability, flexibility, efficiency, performance and availability.

Software Management

Description

Software management is concerned with knowledge about the planning, organization, and monitoring of all software life cycle phases. Management is critical to ensure that software development projects are appropriate to an organization, work in different organizational units is coordinated, software versions and configurations are maintained, resources are available when necessary, project work is divided appropriately, communication is facilitated, and progress is accurately charted.

Systems and Application Specialties

As part of an undergraduate software engineering education, students should specialize in one or more areas. Within their specialty, students should learn material well beyond the core material specified above. They may either specialize in one or more of the ten knowledge areas listed above, or they may specialize in one or more of the application areas listed below. For

each application area, students should obtain breadth in the related domain knowledge while they are obtaining a depth of knowledge about the design of a particular system. Students should also learn about the characteristics of typical products in these areas and how these characteristics influence a system's design and construction. Each application specialty listed below is elaborated with a list of related topics that are needed to support the application.

This list of application areas is not intended to be exhaustive but is designed to give guidance to those developing specialty curricula.

Bimlesh Wadhwa, National University of Singapore, Singapore
Yingxu Wang, University of Calgary, Canada
Mary Jane Willshire, University of Portland, U.S.
Mansour Zand, University of Nebraska, Omaha, U.S.
Jianhan Zhu, University of Ulster, U.K.

Appendix C

CCSE Workshop Attendees

Earl Beede, Construx, U.S.
Pierre Bourque, University of Quebec
David Budgen, Keele University, U.K.
Kai Chang, Auburn University, U.S.
Jorge L. Díaz-Herrera, Rochester Institute of Technology, U.S.
Frank Driscoll, Mitre Cooperation, U.S.
Steve Easterbrook, University of Toronto, Canada
Dick Fairley, Oregon Graduate Institute, U.S.
Peter Henderson, Butler University, U.S.
Thomas B. Hilburn, Embry-Riddle University, U.S.
Tom Horton, University of Virginia, U.S.
Cem Kaner, Florida Institute of Technology, U.S.
Haim Kilov, Financial Systems Architects, U.S.
Gideon Kornblum, Getronics, Netherlands
Rich LeBlanc, Georgia Institute of Technology, U.S.
Timothy C. Lethbridge, University of Ottawa, Canada
Bill Marion, Valparaiso University, U.S.
Yoshihiro Matsumoto, Musashi Institute of Technology, Japan
Mike McCracken, Georgia Institute of Technology, U.S.
Andrew McGettrick, University of Strathclyde, U.K.
Susan Mengel, Texas Tech University, U.S.
Traian Muntean, University of Marseilles, France
Keith Olson, Utah Valley State College, U.S.
Allen Parrish, University of Alabama, U.S.
Ann Sobel, Miami University, U.S.
Jenny Stuart, Construx, U.S.
Linda T. Taylor, Taylor & Zeno Systems, U.S.
Barrie Thompson, University of Sunderland, U.K.
Richard Upchurch, University of Massachusetts, U.S.
Frank H. Young, Rose-Hulman University, U.S.

Appendix D

Internal Reviewers

Barry Boehm, University of Southern California, U.S.
Kai H. Chang, Auburn University, U.S.
Jason Jen-Yen Chen, National Central University, Taiwan
Tony Cowling, University of Sheffield, U.K.
Vladan Devedzic, University of Belgrade, Yugoslavia
Laura Dillon, Michigan State University, U.S.
Dennis J. Frailey, Raytheon, U.S.
Peter Henderson, Butler University, U.S.
Watts Humphrey, Software Engineering Institute, U.S.
Haim Kilov, Financial Systems Architects, U.S.
Hareton Leung, Hong Kong Polytechnic University, Hong Kong

Yoshihiro Matsumoto, Information Processing Society, Japan
Bertrand Meyer, ETH, Zurich
Luisa Mich, University of Trento, Italy
James W. Moore, Mitre, U.S.
Hausi Muller, University of Victoria, Canada
Peter G. Neuman, SRI International, U.S.
David Notkin, University of Washington, U.S.
David Parnas, McMaster University, Canada
Dietmar Pfahl, Fraunhofer Institute of Experimental Software Engineering, Germany
Mary Shaw, Carnegie Mellon University, U.S.
Ian Sommerville, Lancaster University, U.K.
Peraphon Sophatsathit, Chulalongkorn University, Thailand
Steve Tockey, Construx Software, U.S.
Massood Towhidnejad, Embry-Riddle University, U.S.
Leonard Tripp, Boeing Shared Services, U.S.

Appendix E

External Reviewers of First Draft

James P. Alstad, Hughes Space and Communications Company, USA
Niniek Angkasaputra, Fraunhofer Institute for Experimental SE, Germany
Hernan Astudillo, Financial Systems Architects, USA
Donald J. Bagert, Rose-Hulman Institute of Technology, USA
Mario R. Barbacci, Software Engineering Institute, USA
Ilia Bider, IbisSoft AB, Sweden
Grady Booch, Rational Corp, USA
Jurgen Borstler, Umeå University, Sweden
Pierre Bourque, Ecole de Technologie Superieure, Montreal, Canada
David Budgen, Keele University, UK
Joe Clifton, University of Wisconsin - Platteville, USA
Kendra Cooper, The University of Texas at Dallas, USA
Tony Cowling, University of Sheffield, UK
Vladan Devedzic, University of Belgrade, Yugoslavia
Rick Duley, Edith Cowan University, Australia
Robert Dupuis, Universite de Quebec à Monteval, Canada
Juan Garbajosa, Universidad Politecnica de Madrid, Spain
Robert L. Glass, Indiana University, USA
Orit Hazzan, Technion -- Israel Institute of Technology, Israel
Hui Huang, National Institute of Standards and Technology, USA
IFIP Working Group 2.9
Joseph Kasser, University of South Australia
Khaled Khan, University of Western Sydney, Australia
Peter Knoke, University of Alaska, Fairbanks, USA
Gideon Kornblum, CManagement bv, Netherlands
Claude Laporte, Ecole de Technologie Superieure, Montreal, Canada
Ansik Lee, Texas Instruments, USA

Hareton Leung, Hong Kong Polytechnic University, Hong Kong
Grace Lewis, Software Engineering Institute, USA
Michael Lutz, Rochester Institute of Technology, USA
Andrew Malton, University of Waterloo, Canada
Nikolai Mansurov, KLOCwork Inc., Ottawa, Canada
Esperanza Marcos, Rey Juan Carlos University, Spain
Pat Martin, Florida Institute of Technology, USA
Kenneth L. Modesitt, Indiana University - Purdue University Fort Wayne, USA
Ibrahim Mohamed, Universiti Kebangsaan, Malaysia
James Moore, Mitre Corporation, USA
Keith Paton, Independent consultant, Montreal, Canada
Pedagogy Focus Group Volunteers
Valentina Plekhanova, University of Sunderland, UK
Steve Roach, University of Texas at El Paso, USA
Francois Robert, Ecole de Technologie Superieure, Montreal, Canada
Robert C. Seacord, Software Engineering Institute, USA
Peraphon Sophatsathit, Chulalongkorn University, Thailand
Witold Suryan, Ecole de Technologie Superieure, Montreal, Canada
Sylvie Trudel, Ecole de Technologie Superieure, Montreal, Canada
Hans van Vliet, Vrije Universiteit Amsterdam, Netherlands
Frank H. Young, Rose-Hulman Institute of Technology, USA
Zdzislaw Zurkowski, Institute of Power Systems Automation, Poland
